The Roper Center Transparency Score Project is intended to measure disclosure of key elements of survey research. The Transparency Score is *not* an indicator of data quality. Transparency Project scores are calculated as follows: (10 points for providing a dataset+2 points for every other applicable core item+1 point for every applicable additional item)/(total possible points) X 10. Studies with a score >=9 and <=10 greatly exceed Roper Center requirements; scores >=8 and <9 exceed requirements; and scores >=6 and <8 meet Roper Center requirements.

This Washington Post-University of Maryland poll was conducted by telephone April 21-26, 2020, among a random national sample of 1,008 adults with 70 percent reached on cell phones and 30 percent on landlines. Overall results have a margin of sampling error of plus or minus 3.5 percentage points, including design effects due to weighting. The sample of 793 smartphone users has an error margin of plus or minus four percentage points. Sampling, data collection and tabulation by SSRS of Glen Mills, Pa.

METHODOLOGICAL DETAILS

This poll was sponsored and funded by The Washington Post and the University of Maryland's Center for Democracy and Civic Engagement within the College of Behavioral and Social Science's Department of Government and Politics. The poll is of a random sample of adults of the United States, including interviews in English and Spanish. This questionnaire was administered with the exact questions in the exact order as appears in this document unless otherwise noted. These questions were part of an "omnibus" survey in which other questions were asked before or after these questions.

A dual frame landline and cellular phone telephone sample was generated by Marketing Systems Group (MSG) using Random Digit Dialing procedures. Interviewers called landlines and cellular phone numbers. For landline phones, interviewers first request to speak with the youngest adult male or female at home. Cellular phones are treated as individual devices and the interview is conducted with the adult answering the phone. The final sample included 304 interviews completed on landlines and 704 interviews completed via cellular phones, including 469 interviews with adults in cell phone-only households.

This survey uses statistical weighting procedures to account for differential chances of being selected due to landline and cellular phone access and household size. Weighting also corrects for deviations in the survey sample from known population characteristics, which helps correct for differential survey participation and random variation in samples.

The overall adult sample is weighted using a raking procedure to match the demographic makeup of the population by sex, region, age, education, race/ethnicity, marital status, and population density according to Census Bureau estimates. The sample is also weighted to match phone estimates of the share of the population who are cell phone-only, landline-only and mixed user populations according to the National Health Interview Survey. The sample is also weighted to match the average of party identification in the previous two waves of Washington Post-ABC News national polls and this current survey.

All error margins have been adjusted to account for the survey's design effect, which is 1.4 for this survey. The design effect is a factor representing the survey's deviation from a simple random sample and takes into account decreases in precision due to sample design and weighting procedures. Surveys that do not incorporate a design effect overstate their precision.
